What are the differences between Microbial Calf powder used in Performance Healthy Calf Plus and DFM?

- > The Microbial Calf Powder dissolves in milk (the carrier used in the DFM does not)
- > The carrier material used in the DFM is also unable to be digested by calves and therefore is not contained in the Microbial Calf Powder used in Healthy Calf Plus
- > The Microbial Calf Powder does not have as much yeast in it as DFM. The rumen of a calf isn't functioning properly and therefore doesn't need as much yeast for digestion purposes. The main function of the yeast levels that are contained in the Microbial Calf Powder and Healthy Calf Plus is to feed the bacteria.
- > Microbial Calf Powder used in Healthy Calf Plus does not contain enzymes. The calves rumen does not contain forages that require enzymes to break them down.
- > Microbial Calf Powder used in Healthy Calf Plus has the same strains and levels of bacteria to that contained in DFM. These bacterias have been selected to be antagonistic against viruses, ecoli and bad bacteria that effect calf health. Our aim is to get the calf off to a great start and reduce the health issues associated with rearing calves by using bacterial strains that populate the gut to improve overall calf health.
- > As the calves rumen develops they need the bacterial strains more for other functions such as digestion and given that when the bacteria die off they produce enzymes required for digestion we have a product in Healthy Calf Plus that is designed perfectly for calf rearing.

Healthy Calf Plus contains Microbial Calf Powder

Healthy Calf Macro contains DFM

Performance Gel contains Microbial Calf Powder
